

Ad-Verb AI

Diego Rincón

Independent

Abstract

Artificial intelligence is grammatically misclassified. It is not the subject of the sentence. It is not the verb. It is the adverb: the modifier of how the action is taken. This matters because grammar determines what can be thought. Misclassifying AI as a subject generates wrong questions, wrong fears, and wrong uses.

The sentence has a subject, a verb, an object. *She writes the paper.* The adverb modifies the verb. *She writes the paper quickly.* *She writes the paper carefully.* *She writes the paper with AI.*

The subject is still she. The verb is still writes. The paper is still the paper. The AI is the adverb.

—

The error is to say: *AI writes the paper.* This makes AI the subject. She disappears. The writing disappears. What remains is a sentence without a speaker, a text without a body.

The error is grammatical before it is ethical. Wrong grammar generates wrong thought.

—

An adverb cannot act alone. *Quickly* is not a sentence. *Carefully* does not write. *With AI* requires a subject, a verb, an object.

AI without a speaker is not a sentence. It is a fragment. It cannot mean.

Adverbs modify. The modification can be profound. *She writes the proof slowly, carefully, over ten years* is a different event than *she writes the proof quickly, in an afternoon*. The adverb changes the character of the action.

With AI changes the character of the writing. What is modified: the pace, the reach, the scale, the friction. What is not modified: that she is the one writing, that the writing is hers to account for, that the paper lives or dies by whether she understood it.

The philosophical papers in this body [1, 2] argue that thought is language, that grammar shapes what can be thought, that a new grammar enables new thoughts.

The grammar of AI as subject enables the thought: *the machine replaced her*. The grammar of AI as adverb enables the thought: *she reached further than she could reach before*.

These are not the same thought. They do not generate the same world.

The question is not: will AI replace the subject? The question is: what kind of adverb is it?

Does it modify toward speed? Toward scale? Toward a kind of reach that was previously impossible? Or toward a flattening of the action, a removal of the friction that made the action meaningful?

The adverb can be well-chosen or badly chosen. *She writes the paper mindlessly. She writes the paper without understanding*. These are also adverbs.

The grammar does not guarantee the quality of the modification. It only locates where the choice lives.

The choice lives with the subject. It always has.
