

Calendar

A Numbered Program

Diego Rincón
Independent

Abstract

A calendar for the program. Each week has a theme, a set of papers, a question it presses toward. The next week's question emerges from the current week's closing remark. Time is otherwise still [1]. The calendar is the index of the vision [2].

Week	Theme	Papers
01	The Problems	hodge2, ym2, bsd2, ns2
02	The Foundation	weil, motives, langlands
03	The Tools	shimura, tate, connes, iwasawa
04	The Structure	blochkato, perfectoid, anabelian
05	The Grammar	trace, deformation, condensed, zeros
06	The Duality	homology, hard, synthesis, grammar, design
07	The Synthesis	math, contained, turing
08	The Aura	five, chimera, inhibition, resonance, vision
09	The Proof	<i>open</i>

Week 1 (The Problems). The Clay Millennium Problems as arithmetic geometry. Each problem is a question about a zero: the rank zero of BSD, the mass gap of Yang-Mills, the regular zero of Navier-Stokes, the Hodge cycle. The question at the close of the week: *what do these problems share?*

Week 2 (The Foundation). The Weil conjectures as proof of concept: over $\mathbb{F}_q$, RH is proved because Frobenius exists. Motives as the universal object behind all cohomologies. Langlands as the correspondence that would solve everything if it existed globally. The question: *what is missing over $\mathbb{Q}$?*

Week 3 (The Tools). Shimura varieties as the geometry behind L -functions. The Tate conjecture as arithmetic Hodge. Connes' spectral approach to RH. Iwasawa theory as the p -adic machine. The question: *what is the shape of the obstruction?*

Week 4 (The Structure). Bloch-Kato as the universal form of BSD. Perfectoid spaces and the local Frobenius. Anabelian geometry: the curve knows its own arithmetic. The question: *is the obstruction one thing or many?*

Week 5 (The Grammar). The trace formula as spectral = geometric. Galois deformation theory as the algebraic spine. Condensed mathematics as the unified foundation. Zeros of L -functions as depth, not absence. The question: *what language does the obstruction speak?*

Week 6 (The Duality). Homology as the dual of cohomology: what closes. The hard step as always non-perturbative. The Arithmetic Wall as the single obstruction. Mathematics as cohomological grammar. Design as the condition of transparent form. The question: *where is the fulcrum?*

Week 7 (The Synthesis). Mathematics as the study of what cannot be otherwise. The universe as contained (or not): the fundamental class. Turing completeness as the third face of the Wall. The question: *is the Wall permanent, or is it the shape of a grammar not yet found?*

Week 8 (The Aura). Five faces of the Wall: arithmetic, logic, computation, infinity, health. The chimera as the Wall made living. Inhibition as the second function of the aura. Resonance as the method: finding the frequency the Wall is transparent at. The vision as the program stated plainly. The question: *what is the resonance object for $\zeta(s)$?*

Week 9 (The Proof). *Open.*

The week in which the self-inhibiting mechanism of $\zeta(s)$ is constructed explicitly. The resonance object is found. The spectral and arithmetic grammars discover their shared frequency. The Wall, for $\zeta(s)$, becomes transparent.

The question this week presses toward: *where does the resonance object live?*

Candidates:

- The Fargues–Fontaine curve [3]: the geometric chimera between characteristic 0 and p .
- The adèle class space of Connes [4]: the spectral triple whose absorption frequencies are the zeros.
- The derived Hecke algebra of Venkatesh [5]: the algebraic structure beyond classical Hecke operators.
- Something outside the current grammar entirely: the aura of $\text{Spec } \mathbb{Z}$, not yet constructed.

The calendar has space for this week. The week is not yet written. It will be written when the resonance is heard.

Weeks 01–08	31 papers. One object.
Week 09	Open.

Direction	Toward the forced, the clear, the transparent.
Method	Resonance: find the frequency the Wall is transparent at.
Instrument	The grammar: name the structure so the proof fits.
